Technical Bulletin No. 9

Washability

Some of the caster types offered by GROSS + FROELICH GMBH & CO. KG can be manufactured to meet the requirements for automatic industrial washing systems by using more temperature-resistant materials (brief periods up to 80C)

The metal parts of these casters are either stainless steel or chromate conversion coated which protects them from corrosion.

It is important to verify that the cleaning agents used on our products are compatible with the materials we use (mostly PA, PP, and TPU) and do not destroy the plastics.

Please check the according types with our sales team as needed. We are glad to recommend the appropriate caster type for you.
