Detergents and Maintenance Agents for Flooring

Our casters are resistant to most commercial agents used for cleaning and floor maintenance.

Due to the variety of agents offered it is helpful to do testing prior to use, especially concerning the use of special cleaning and maintenance agents such as disinfectants.

Cleaning and maintenance agents may leave residue after applying, especially when being used with modern, xeric cleaning methods. These residues may settle on the tread of the casters without affecting the caster itself.

Depending on the cleaning methods, these residues on the tread may produce noticeable layers of sediments. Over time, these layers may come off in small particles when using the chair and could cause staining on the floor.

The tread of the caster should be kept clean in order to prevent the loose sediment particles from staining the floor. Normally, this sediment can be removed easily through cleaning.

To prevent the casters from picking up sediment, or at least to slow this process down, it is important to make sure that the cleaned floors have dried completely before rolling office chairs over them again. Please also see the manufacturer's general information.
